

Facts and Resources on Child Firearm Suicide

Gun violence has a devastating impact on children in America. **In fact, 40 percent of child gun deaths are suicides**—more than 600 child gun suicides each year.¹ One study showed that over 80 percent of children under the age of 18 who died by gun suicide used a gun belonging to a parent or relative.² For people of all ages, access to a gun increases the risk of death by suicide by three times.³

Most people who attempt suicide do not die—unless they use a gun.⁴ In fact, 90 percent of suicide attempts with a gun result in death—a much higher fatality rate than any other means of self-harm.⁵ This contributes to the fact that 40 percent of child suicides involve a gun.⁶

A national survey of high school students found that 17 percent had seriously considered attempting suicide within the last year.⁷ And one study showed that 41 percent of adolescents in gun-owning households report having “easy access” to the guns in their home.⁸

Signs to look out for when concerned that a loved one may be suicidal:⁹

- Prolonged sadness and depression
- Changes in mood or behavior
- Hopelessness
- Sleeping too much or too little
- Withdrawing/Isolation
- Aggression or agitation
- Increased alcohol or drug use
- Talking about killing themselves

Research shows that secure firearm storage is associated with a decreased risk of child firearm suicide. One study showed that households that locked both firearms and ammunition had a 78 percent lower risk of self-inflicted firearm injuries among children and teenagers.¹⁰

Some additional key steps you can take to support your loved one include: inviting an honest conversation, listening and supporting your loved one, and encouraging them to see a mental health professional or a primary care physician.¹¹
